## Open Access: bringing scientific results faster to a broader audience

Posted by [Henk van den Hoogen](#) on 06. Jan, 2010

Modern science can be characterized as a close and intensive collaboration within a network of scientists. The Internet has proven to be an efficient 'expeditor' in the exchange and publication of scientific results. Open Access offers lots of opportunities.

**Effect of preoperative statin therapy on myocardial protection and morbidity endpoints following off-pump coronary bypass surgery in patients with elevated C-reactive protein level**

Young Song, M.D., Young Lan Kwak, M.D., PhD., Yong seon Choi, M.D., PhD., Jong Chan Kim, M.D., Sang baek Heo, M.D., Jae Kwang Shim, M.D., PhD.

Department of Anesthesiology and pain medicine Yonsei University College of Medicine

**Background** The aim of this study was to investigate the effects of preoperative statin therapy on myocardial protection and morbidity endpoints following off-pump coronary bypass graft surgery (OPCAB) in patients with elevated serum high sensitivity C-reactive protein (hs-CRP) level.

**Methods** Of the 492 patients who underwent multivessel OPCAB from March 2007 to February 2009, the records of 144 patients whose baseline hs-CRP level > 2 mg/L were reviewed. According to the history of preoperative statin therapy for at least 1 week, patients were classified as either statin or control group (72 subjects, each). Preoperative and operative characteristics and postoperative data including troponin (Tn) - T level, major morbidity endpoints were obtained and compared. Major morbidity endpoints were defined as permanent stroke, renal dysfunction, hemostatic re-exploration, deep sternal wound infection, and number of patients requiring prolonged ventilation.

**Results** Preoperative and operative characteristics were all similar between the 2 groups. There were no significant differences in the incidence of morbidity endpoints between the 2 groups, except for the number of patients requiring dialysis which was significantly lower in the statin group (8 vs. 1, p=0.033). Tn - T level at 24 h after surgery was also significantly lower in the statin group.

**Conclusions** In this study, we observed beneficial effect of preoperative statin therapy for at least 1 week in terms of less myocardial enzyme release and less number of patients requiring dialysis following OPCAB in patients whose preoperative hs-CRP was elevated.

**Key Words** C-reactive protein, Off-pump coronary artery bypass surgery, Statin.
